Familial and social conditions of alcohol drinking in children and adolescents

Maciorkowska E*, Buraczewska E, Sacharewicz A

Department of Pediatric Nursing, Medical University of Białystok, Poland

Abstract

Purpose: The aim of the study was to evaluate the frequency of alcoholic beverage use among children and young people of Białystok city and to assess the influence of familial and environmental factors on this phenomenon.

Material and methods: The study included 894 pupils in the city of Białystok. An anonymous questionnaire, prepared in the Department of Pediatric Nursery of the Medical University of Białystok was used in the study.

Results: The examinations revealed that alcohol use among adolescents of Białystok increases with the increasing age of pupils (33.2% – the first grade of middle school, 63.4% – the third grade of middle school, and 79.9% – the second grade of high school). The first experience with alcohol took place in the 5-10 age bracket, but the greatest alcohol initiation (35% of young people) was reported in the 10-15 age bracket; 16% of children were not capable of establishing proper relations with their parents. The examined pupils observed destructive behavior most frequently among their friends (38%) and in people with whom they had no direct contact (36.8%). Adolescents were revealed to use alcohol for company (21.6%), due to lack of safety feeling (18.4%), and the ability of free time organizing (23.4%).

Conclusion: 1. Alcohol use by children and adolescents from the city of Białystok increases with the age and the biggest alcohol initiation takes place in the age of 10-15 brackets. 2. Familial and social conditioning/factors influence alcohol use by children and adolescents.

Key words: children and adolescents, alcohol, familial and social conditioning.

Introduction

The development of civilization creates numerous positive possibilities of the intellectual, physical, and psychosocial development of a young man. However, it can also bring about situations that influence negatively on his health [1].

The school age is a period of a child’s dynamic development, in which behavior and abilities are created. It is also the period in which many disorders appear or are deepened and then are brought to the adult life.

The health potential, from childhood and adolescence, determines health, quality of further life, and proper functioning in the society [2].

According to the World Health Organization, alcohol use is one of the main risk factors for the health of young people [3]. The results of various studies, both in Poland and other countries, point to the fact that more than 80% of adolescents start drinking alcohol before 18 years of age [4-7]. Over 25% of examined pupils admit at least 4 alcoholic intoxications, treating it as “the life success” [8]. The National Agency for Alcohol Problems Solution in Poland stresses that each year the number of young people consuming alcohol increases and the age of alcohol initiation decreases [9]. The relation between the familial and social factors and children’s drinking alcohol has been stressed in many studies. The relation to alcohol in adolescents’ social environment as well as general situation in their families attracts a particular attention [9]. A detailed analysis of these factors can contribute to the establishment of effective prophylactic strategies in order to diminish the number of children and adolescents drinking alcohol.

The aim of the study was to evaluate the frequency of alcoholic beverage use among children and young people of Białystok city and to assess the influence of familial and environmental factors on this phenomenon.
Material and methods

The study included 894 pupils of the first grades (319 pupils) and of the third grades of middle schools (284 pupils), and the second grades of high schools (291 pupils) from schools randomly chosen in the city of Białystok in 2006. Girls comprised 52.5% while boys – 47.5% of the examined population. An anonymous questionnaire, worked out in the Department of Pediatric Nursing, was used in the study. The part entitled “You and your family” consisted of 25 questions concerning family and social conditions of alcohol consumption by children and adolescents while the part entitled “You and alcohol” was made up of 14 questions. Children’s parents, adolescents above 16 years old, the Board of Science and Education in Białystok, the headmasters of randomly chosen schools as well as the Bioethical Committee of the Medical University of Białystok gave their consent for the study.

The results were presented in correlation tables containing absolute numbers and appropriately counted percentage values, with the use of Statistica 5.0 program.

Discussion

The results showed that the number of young people consuming alcohol increased with age (33.2% – the first grades of middle school, 63.4% – the third grades of middle school, and 79.7% – the second grades of high school) and each year the age of alcohol initiation decreased. It was also confirmed by national questionnaire studies ESPAD of 2003. According to them, alcohol was tested by 92.5% of the third grade of middle school pupils and 96.7% of the second grade of high school pupils [10]. The family takes the moral and legal responsibilities for the health of their children. According to Muszalik and Bartuzi, the family should be a model and ally of school in the creation of pro-healthy behavior [1].

One of the watchwords of the World Health Organization, “Health starts at home”, points to a significant role that is played by a family in the promotion of health of its members [1].

Woronowicz has stressed that, bringing up children in sobriety, presenting information of bad habits and creating a proper life style, is of great importance in prophylactic actions [11]. Parents should comment on the causes of alcohol abuse observed by children in the street or on TV and instill proper behavior standards in their children [12-14].

Thus, the system of preventive bringing up is based on the rational appropriate activities and creation of such a conduct of a young person, which could be deprived of inappropriate behavior and deviations and should also concentrate on egoistic and asocial conduct [15].

Moreover, the studies revealed that approximately 20% of parents of the examined pupils did not try to discuss the problem of alcohol with their children due to lack of competence and knowledge on alcohol use and abuse. It was also confirmed by studies carried out in Wroclaw. The results of these studies stressed that a large amount of parents (37%) is interested in gaining information concerning bad habits and ways of helping young people having drinking problem [1]. Therefore, it is required to conduct wide and detailed education of not only among young people but also their parents. It is important for them to know causes and mechanism of habit formation in order to recognize the danger and take up prophylactic actions.
Among familial factors, conditioning alcohol consumption by adolescents, the parents relation to the phenomenon plays a great role. According to studies conducted by Niełacny, 37% of parents do not realize that their children drink alcohol. Moreover, 15% of those who knew, accepted such a behavior while 14% were indifferent [16]. The results of many studies give a warning that young people, whose parents drink a lot, use alcohol more often than those whose parents do not drink [12,17,18]. Thus, it is alarming that 16% of the examined young people can observe their parents drinking alcohol always whenever there is an occasion to drink and 5% – parents drinking even without an occasion. It can lead to the conviction that drinking is common and is accepted in the society as children take the models from specific behaviors of their parents than on what others say [19,20].

Young people state that mutual understanding, the system of rewards, more toleration of their parents regarding school and free time are the issues they expect from their parents.

The study by Jelonkiewicz and Kościńska-Dec showed that support and control as the factors of familial process are connected with drinking by adolescents [21]. It was observed that the weak support and a poor control of parents are strictly connected with the intensified drinking by young people. Our study revealed that 7.2% of young people has difficulty with establishing good relations with their fathers, 2.5% – with their mothers, and 6.3% are not able to establish proper relations with both their parents.

Accoding to Lowe et al. drinking alcohol by young people is connected with improper mother-child or father-child relations [22]. It was confirmed by Chassin and DeLucia [23]. Young people abuse alcohol more frequently in families, where parents are not emotionally connected with their children and are not consequent in their bringing up practices. Simultaneously, Stepien stresses that in girls – the most important is emotional relation to their parents while in boys – decisive and conventional rules of the familial life [24].

Conflicts in family (separation, divorce, violence in family), pathological ways of problems solving, lack of interest of parents in their children life and behavior, use of improper bringing up methods – the passive conduct of the parents, their tolerance, urging children to drink or buy alcohol, financial problems, the breakdown of familial rituals (shared meals, holidays and vacation), feeling of danger, lack of strong model of mother or father in the family are other negative factors that influence drinking alcohol by children and young people [12,23,25,26].

Besides familial factors, the environment and peers have also an effect on drinking alcohol by adolescents. Raundner claims that too much tolerant social conduct to that kind of phenomenon is another supporting factor of drinking alcohol by young people [26].

Kobrzyńska and Marcinkowski add that teachers and tutors are frequently too tolerant to alcohol drinking by their charges and such a tolerance can sometimes take the form of consent and is manifested with lack of interest in the problem and liberal treatment of the alcohol-influenced pupils [27]. Moreover, easy access to alcohol undoubtedly benefit the intensification and distribution of drinking alcohol by children and adolescents.

Despite the statutory ban on selling alcohol to minors, more than 30% of the examined reported that a shop assistant did not ask for the identification document. Inefficiency of rules that limit the access to alcohol for young people was also confirmed by ESPAD studies [10].

As it was shown in the studies, young people from Białystok city use alcohol most frequently not to stand out from the group, lack of safety, self-confidence, and certain skills, such as organizing free time and getting to know new people. Thus, they drink because they have problems with social, family, and emotional life, and the acceptance in the environment.

According to Bartnicka, these are the main factors that favor, initiate, and consolidate alcohol use by adolescents [25]. It was observed that destructive behavior was most frequently seen by young people among their friends (38%).

Muszalik et al. stressed that the number of drinking young people who adopt the standards from their peers increases [28]. It happens due to the fact that the child treats alcohol as the means of gaining the acceptance and contacts in the group.

Other social factors affecting alcohol use by young people are as follows: local destructive environment, school concentrated on the didactic function and no or minimum bringing up function, lack of appropriate knowledge concerning properties, action, and effects of alcohol use, and specifically knowledge that alcohol is a substance not necessarily harmful for young people.

Many authors claim that alcohol use by young people should be openly countered due to health and bringing up considerations and should not be tolerated in the society.

According to Muszalik and Bartuzi, introducing the consistent programs of bringing up without bad habits, raising young people and teachers’ attention as well as cooperation with the family could bring expected results [1].

**Conclusions**

1. Alcohol use among children and young people from Białystok city increases with the age, and the biggest alcohol initiation is in the 10-15 age brackets.

2. Familial and social conditioning have the influence on alcohol use by children and young people.
